19	20	21	22	23	24	25
20	21	22	23	24	25	26
21	22	23	24	25	26	27
27	28	29	30	31		

## Practise & Creating Table

24 Monday

Column Name	Datatype	Size	Constraint	Constraint name
User_id	Number	11	Primarykey	PK_USERS
Name	Varchar2	20		
Address	Varchar2	100		
Phno	Number	11		
Emailid	Varchar2	30		

create table users(  
 user\_id number(11),  
 name varchar2(20),  
 address varchar2(100),  
 phno number(11),  
 emailid varchar2(30),  
 constraint pk\_users primary key (user\_id)  
 );

## Alter Table

Write a query to add a new column, LiveTracker of data type char(1). This will be used to track the live location of the bus, for the journey.

desc buses;

Name	Null?	Type
BUS-NO	NOT NULL	NUMBER(11)
BUS-NAME		VARCHAR2(20)
TYPE		VARCHAR2(20)
TOTAL-SEAT		NUMBER(11)
AVAIL-SEAT		NUMBER(11)

April						
S	M	T	W	T	F	S
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	31				

alter table buses add  
 livetracker char(1);

Tuesday 25

(115 - 250) Wk 17

Q.1. Write a query to create Distributor table w. constraints method mentioned.

Distributor	
Distributor_ID	varchar(10)
Distributor_Name	varchar(20)
Address	varchar(100)
MobileNumber	number(10)
Email	varchar(30)

create table distributor(  
 distributor\_id varchar(10),  
 distributor\_name varchar(20),  
 address varchar(100),  
 mobilenumber number(10),  
 email varchar(30),  
 constraint pk primary key (distributor\_id)  
 );

Q.2. W.A.Q. to create Customer\_info table w. constraints mentioned.

← Previously, object were created. Now April 2017 since the objects are created, it should hold the data.

## Data Manipulation Language

26 Wednesday

Defines the Data of Table.

- 1. INSERT
- 2. UPDATE
- 3. DELETE
- 4. SELECT

### INSERT ROWS TO TABLE

Syntax → `INSERT INTO TableName[(column1, column2...)] VALUES (value1, value2...);`

Example → `INSERT INTO Customer VALUES (1, 'Tom', 9876523190, 'Tom@gmail.com', 'Mumbai');`

Data for DATE, CHAR and VARCHAR types should be always enclosed within single quotes.

Specific insertion → `INSERT INTO Customer (Id, Name, phoneNo, address) VALUES (2, 'Minu', 91283, 'Chennai');`

### UPDATE ROWS IN TABLE

`UPDATE TableName SET ColumnName = value [, ColumnName = value, ...] [WHERE condition];`

W	S	M	T	W	T	F	S
9		1	2	3	4	5	6
10	5	6	7	8	9	10	11
11	12	13	14	15	16	17	18
12	13	14	15	16	17	18	19
13	14	15	16	17	18	19	20
14	15	16	17	18	19	20	21
15	16	17	18	19	20	21	22
16	17	18	19	20	21	22	23
17	18	19	20	21	22	23	24
18	19	20	21	22	23	24	25
19	20	21	22	23	24	25	26
20	21	22	23	24	25	26	27
21	22	23	24	25	26	27	28
22	23	24	25	26	27	28	29
23	24	25	26	27	28	29	30
24	25	26	27	28	29	30	31

Freedom Day (South Africa)

W	S	M	T	W	T	F	S
1	2	3	4	5	6	7	8
9	10	11	12	13	14	15	16
17	18	19	20	21	22	23	24
25	26	27	28	29	30	31	

Modify existing rows with the `UPDATE` statement.

Thursday 27  
(117 - 248) Wk 17

`UPDATE Customer SET emailid = 'Tiny15@gmail.com' WHERE cname = 'Tiny';`

All rows in the table are modified if we omit the WHERE clause.

`UPDATE Customer SET emailid = 'Tiny15@gmail.com';`

### DELETE ROWS FROM TABLE

`DELETE [FROM] table [WHERE condition];`

Remove existing rows from a table by using the `DELETE` statement.

• `DELETE FROM Customer WHERE Id = 2;`

To delete all rows from the table.

• `DELETE FROM Customer;`

Deletion is not possible if the rows to be deleted is referred in the child table.

Deletion of the parent record is made possible by using a foreign key reference option.

April 2017

28 Friday

(118 - 246) Wk 17

- CASCADE** → Deletes the row from the parent table, & automatically deletes the matching rows in the child table.
- SET NULL** → Deletes the row from the parent table, & sets the foreign key column in the child table to NULL.
- RESTRICT** → Rejects the delete or update operation for the parent table.  
This is default option.

Syntax ⇒ REFERENCES tab\_name (index\_col\_name,...)  
[ON DELETE reference\_option]

- reference\_option: RESTRICT | CASCADE | SET NULL

### ON DELETE CASCADE

When a record is removed from the customer table, it should also be removed from the related records in the enrollment table.

Use "ON DELETE CASCADE" while creating a table.

CREATE TABLE PolicyEnrollment(Enrollment number (5) primary key, Cid number (10) references customer (Cid) ON DELETE CASCADE, Pid varchar(20), DueDate date, PaidDate date, Penalty number (10));

March						
S	M	T	W	T	F	S
9			1	2	3	4
10	5	6	7	8	9	10
11	12	13	14	15	16	17
12	19	20	21	22	23	24
13	26	27	28	29	30	31

1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	31				

May						
S	M	T	W	T	F	S
18	19	20	21	22	23	24
25	26	27	28	29	30	31

### ON DELETE SET NULL

Saturday 29  
(119 - 246) Wk 17

If you want to set null values instead of removing the record from the transaction table, how do you do that?

Use "ON DELETE SET NULL" while creating the table.

CREATE TABLE PolicyEnrollment(EnrollmentId number (5) primary key, Cid number (10) references customer (Cid) ON DELETE SET NULL, Pid varchar(20), DueDate date, PaidDate date, Penalty number (10));

### DELETE VS TRUNCATE

#### DELETE

- Deletes all rows or a specific row from the table
- Can be reverted to its previous state

- Rows that are referred in the child table cannot be removed.

#### TRUNCATE

- Removes all rows from the table.

Cannot be reverted.

Will not work if the truncated table is referenced.

April 2017

30 Sunday  
(20-245) Wk 18

March						
S	M	T	W	T	F	S
			1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	

**MERGE** :- Provides the ability to conditionally update or insert data into a DB table.

• Performs an UPDATE if the row exists & an INSERT if it is a new row.

- ↳ Avoids separate update
- ↳ Increases performance & ease of use.

The MERGE statement is deterministic.

↳ Cannot update the same row of the target table multiple times in the same MERGE statement.

Syntax =>

```
MERGE INTO table-name table-alias  
USING (table/view/sub-query) alias  
ON (join condition)  
WHEN MATCHED THEN  
    UPDATE SET
```

col1 = col-val1,  
 col2 = col-val2

```
WHEN NOT MATCHED THEN  
    INSERT (column-list)  
    VALUES (column-values);
```

Eg: Maintain a table policyhistory which will allow have the Policy Name & the no. of times the policy has been borrowed.  
- Insertion should happen when a policy is taken for the first time & update of the count for the next time.

Notes

Example =>  
**MERGE INTO** policyhistory **as ph**  
**USING** Policy P  
**ON** (ph.pname = p.pname)  
**WHEN MATCHED THEN**  
**UPDATE SET** ph.count = ph.count  
+ 1  
**WHEN NOT MATCHED THEN**  
**INSERT** (ph.pname, ph.count)  
**VALUES** (p.pname, 1)

**ROLLBACK** → Reverting the data.

↳ Reverting the data until a check point is done by save point.

## **DATABASE TRANSACTIONS**

1. A transaction is a logical unit of work.
2. Oracle ensure data consistency based on transactions.
3. Transaction does consistent data change.
4. Transaction begins when DML statement is executed.
5. Transaction should end with either commit or Rollback.
6. DDL commands are by default auto commit.

**Commit** => Ends the current transaction by making all pending data changes permanent

**SAVEPOINT** → Marks a save point within the savepoint-name

**ROLLBACK** → ROLLBACK ends the current transaction by discarding all pending data changes.

## Monthly Planner

25	26	27	28	29	30		

Monday 1

[22] [244] Wk 18

ROLLBACK TO  
Savepoint-name

ROLLBACK To

SAVEPOINT

rolls back the current transaction to the specified savepoint, thereby discarding any changes or savepoints created after the savepoint to which you are rolling back.

LOCKING :- Prevent destructive interaction between concurrent transactions when accessing shared resources.

Locking is performed automatically & requires no user action.

Uses the lowest level of restrictiveness.

Locks are held for a duration of a transaction

Types -

- Explicit locking
- Implicit locking

May 2017

Ques. Insert the following records to the department table.

2 Tuesday

Department_id	Department_name	Department_block_no.
1	Computer Science	3
2	Information Tech.	3
3	Software Engineering	3

Soln. Commands for inserting records to already existing tables is INSERT.

- All the columns have values, so it's not necessary for you to bring in column names & then pass on the values.

```
insert into department values (1, 'Computer Science'
insert into department values (2, 'Information Technology'
insert into department values (3, 'Software Engineering')
```

\* Column names & Table names can be case insensitive but values can't.

Ques. Write a query to change the bus type to 'AC' for all buses.

Buses	
BUS_NO	number(11)
BUS_NAME	varchar(20)
TYPE	varchar(20)
TOTAL_SEATS	number(11)
AVAIL_SEATS	number(11)

Soln.

```
update buses set
```

```
type = 'AC';
```

# Select Statement

W	S	M	T	W	T	F	S
122	243	Wk 18					
123	244	Wk 19					
124	245	Wk 20					
125	246	Wk 21					
126	247	Wk 22					

Wednesday 3

- Also a form of DML statement:
- but mainly used for data retrieval statement.
- The SELECT statement of SQL is used to retrieve data from one or more tables or views.
- The result returned is stored in a temporary result table, called the result-set.

SELECT can be used for retrieving :-

1. all rows from a table
2. specific rows from a table
3. specific values from a table.

## SELECT Syntax

```
SELECT [distinct] [column_name,  
column_name2...]*
```

```
FROM table_name[alias][,table_name[alias]...]
```

[WHERE conditions]

[GROUP BY group[HAVING group-condition]]

[ORDER BY sort\_columns[Asc/Desc]];

Note:- SQL statements are not case sensitive, but the data stored in the DB is case sensitive.

Ex. a member with the name TOM & tom are diff., but SELECT & select are the same statement.

May 2017

Retrieve all the records.

W	S	M	T	W	T	F	S
13/18	30						
14	2	3	4	5	6	7	8
15	9	10	11	12	13	14	15

26	25	26	27	28	29	30	

4 Thursday  
(124 - 240) Wk 18

Query:

**SELECT \* FROM Customer;**  
(Customer table)

Retrieve Specific Columns-

Query:  
**SELECT cname, address FROM Customer;**

CNAME	ADDRESS
Tom	Chennai
John	Delhi
Ram	Pune
Tiny	Chennai

Arithmetic Expressions

The given query help us to know the min. amount to be paid for the policy including its GST of 10%.

PID	PNAME	PPERIODINYEARS	MINAMOUNTPERMONTH
MBP	Money Back Plan	20	1000
PP	Personal Protect	15	1500

**SELECT pid, Minamountpermonth + (Minamountpermonth \* 0.1)  
FROM policy;**

PID	MINAMOUNTPERMONTH + (MINAMOUNTPERMONTH * 0.1)
MBP	1100
PP	1650

Column Alias

Previous results set has the off expression of the entire expression became the column heading bcz no column alias was given.

Here, the result set will have the off of the expression.

- Column name is overridden with the alias name provided in the statement.

**SELECT pid, Minamountpermonth + (Minamountpermonth \* 0.1)  
Policy Amount from policy;**

PID	POLICYAMOUNT
MBP	1100
PP	1650

Arithmetic expressions containing a NULL value evaluated to NULL.

Enclose the alias name in double quotes, if it contains space between words.

Concatenation Operators

Ques. How to display the customer name along with their address in the following format "CustomerName" lives in "Address"?

|| operator is used to concatenate columns or character strings.

May 2017

6 Saturday  
128 - 238 Wk 18

### CUSTOMER ADDRESS

Tom	lives in Chennai
John	lives in Delhi
Ram	lives in Pune
Tiny	lives in Chennai

W	S	M	T	W	T	F	S
13/18	30						
14	2	3	4	5	6	7	8
15	9	10	11	12	13	14	15
16	16	17	18	19	20	21	22
17	23	24	25	26	27	28	29
18	30	31					

SELECT Cname || 'lives in' || Address as CustomerAddress FROM customer;

### Eliminating Duplicate Rows :-

To eliminate duplicate records while retrieving, we use DISTINCT keyword in SELECT clause.

SELECT DISTINCT address FROM customer;

ADDRESS
Chennai
Delhi
Pune

WHERE CLAUSE:- The rows return from the query can be restricted by using the WHERE clause.

A WHERE clause contains the condition that must be met. If it directly follows the 'FROM' clause.

SELECT \* | {DISTINCT} column | expression [alias], ... }

FROM table [WHERE condition(s)];

W	S	M	T	W	T	F	S
15/20	27	1	2	3	4	5	6
16	9	10	11	12	13	14	15
17	16	17	18	19	20	21	22
18	23	24	25	26	27	28	29
19	30	31					

W	S	M	T	W	T	F	S
21	22	23	24	25	26	27	28
26	27	28	29	30	31		
29	30	31					

Sunday  
(127 - 238) Wk 19

- Values in the condition is compared using relational operators.
- Logical operators are used to specify more than one condition in WHERE clause.

SELECT cname, emailid, address FROM customer  
WHERE address = 'Chennai';

### Comparison Operators :-

=, >, >=, <, <=, (!=, <>)

Between ... and → Range of values.

In (Set) → Match any of the list values.

Like → Match a character pattern

Isnull → Is a null value.

SELECT \* FROM Policy WHERE MinAmountPerMonth < 1500;

SELECT \* FROM cid, cname, emailid FROM customer  
WHERE emailid LIKE '%@yahoo%';

Like operator ⇒ '%' denotes zero or many characters

⇒ '\_' denotes one character.

Note :- A null is not the same as zero or a space. Zero is a number. Space is a character. If any operation has NULL value, then the result is NULL.

May 2017

W	S	M	T	F	S
13/05/18	30				
14	2	3	4	5	6
15	9	10	11	12	13
16	16	17	18	19	20
17	23	24	25	26	27
18	28	29	30	31	

8 Monday  
(129 - 237) Wk 19

## OPERATORS MEANING

Between X and Y Range of values between X and Y (X, Y is inclusive)

## EXAMPLE

... WHERE Salary Between 5000 and 8000.

In Set

Match any of the list values

IS NULL

is a null value

... WHERE Salary IN (5000, 6000, 7000)  
... WHERE Salary IS NULL

To retrieve policy details where minimum amount to be paid is between 2500 & 5000

SELECT \* FROM policy WHERE MinAmountPerMonth BETWEEN 2500 AND 5000;

To retrieve customer id & policy id of customers whose customer id is 101, 105

SELECT cid, pid FROM policyenrollment WHERE cid IN (101, 105);

To retrieve policy enrollment details of those who have not paid penalty for late payment.

SELECT \* FROM policyenrollment WHERE penalty IS NULL;

## Logical Operators

AND, OR, NOT

⇒ SELECT cid, cname FROM customer WHERE cid = 1 AND address = 'chennai';

W	S	M	T	F	S
13/05/18	30				
14	2	3	4	5	6
15	9	10	11	12	13
16	16	17	18	19	20
17	23	24	25	26	27
18	29	30	31		

## Order by clause

To retrieve names of the customers in ascending order.

SELECT cname FROM customer ORDER BY cname;

Default : - ascending order

for descending order :-

SELECT cname from customer order by cname desc;

Ques. Write a query to display all staff details & sort the result by ID in ascending order.

## Staff

staff\_id number → PK

staff\_name varchar(30)

department\_id number → FK

some → select \* from staff order by staff\_id asc;

## Other Examples :-

⇒ select \* from staff where staff\_id > 12 order by staff\_id desc;

⇒ select staff\_id, staff\_name, department\_id from staff order by staff\_id;

W	S	M	T	F	S
